

Sharjil Siddiqui

Technical Support & Debugging Engineer | Full-Stack Background

sharjilsidd187@gmail.com | +91 9552190178 | Aurangabad, Maharashtra, India | [LinkedIn](#) | [GitHub](#)

PROFESSIONAL SUMMARY

Engineer who enjoys the investigation as much as the fix: reproducing customer-reported issues, tracing them to root cause across the frontend, REST APIs, and authentication layers, and validating fixes before they ship. Built this habit while owning production stability across five enterprise SaaS products — triaging GitLab tickets, debugging APIs with browser DevTools and curl, and troubleshooting authentication, RBAC/SSO, and cloud integration issues end-to-end. Comfortable working across AWS and Azure infrastructure, with hands-on experience writing and troubleshooting SQL against PostgreSQL, MySQL, and MongoDB. Uses AI tools (Cursor, Claude, ChatGPT) daily to speed up investigation, documentation, and code review — while always verifying findings against actual system behavior rather than trusting output blindly. Looking to bring this cross-stack, customer-focused troubleshooting mindset into a dedicated database and platform support role.

TECHNICAL SKILLS

Programming Languages: JavaScript, Python

Databases & Querying: SQL, PostgreSQL, MySQL, MongoDB, Firebase Firestore

Cloud & Infrastructure: AWS integrations, Azure account onboarding and connectivity, cloud-hosted SaaS platforms

Debugging & Production Support: Production debugging, root cause analysis, REST API debugging (browser DevTools, curl), incident investigation, bearer token/authentication troubleshooting, bug reproduction and fix verification, ticket triage and investigation (GitLab), performance analysis

Authentication & Security: Authentication, RBAC, Enterprise SSO, feature flags

Frameworks: React, Next.js, Nuxt.js, REST APIs

Developer Tools: Git, GitHub, VS Code, ApiDog

AI-Assisted Engineering: Using Cursor, Claude, and ChatGPT to accelerate debugging, root cause investigation, code review, and technical documentation — always cross-checked against actual system behavior rather than trusted blindly

EXPERIENCE

Frontend Lead — Aortem Inc

May 2026 – Present

- Act as a first responder for production issues across five enterprise SaaS products (DartCodeAI, DartStream, TechniDox, IntelliToggle, DartCloudFunctions), owning technical investigation from initial customer report through verified resolution.
- Investigate and triage GitLab-tracked tickets, performing root cause analysis across frontend, REST API, and authentication layers to separate genuine defects from configuration or environment issues.
- Debug REST APIs directly using browser DevTools (Console, Network tab) and curl requests, tracing failures down to malformed requests, bearer token and authentication problems, and backend response errors.
- Validate authentication, RBAC, and Enterprise SSO flows end-to-end, reproducing edge cases and confirming fixes before release.
- Test Azure account onboarding and AWS integration flows for enterprise customers, verifying connectivity and identifying blockers before they reach production.
- Partner directly with backend engineers on complex, cross-stack issues — documenting findings and writing detailed engineering comments covering root cause, blockers, and verification steps until resolution.
- Own technical delivery for enterprise-facing modules including analytics dashboards, admin interfaces, licensing systems, and feature flag rollouts.
- Lead frontend architecture and technical decision-making across the product suite, balancing new feature delivery against production stability.
- Review pull requests and enforce code quality and architecture standards across the frontend codebase.
- Mentor and coordinate frontend interns, and lead technical and product discussions to align engineering work with cross-functional priorities.

Frontend Intern — Aortem Inc

Jan 2026 – May 2026

- Reproduced and investigated production bugs reported through GitLab tickets, working under guidance from senior engineers to determine root cause.
- Debugged REST API and authentication issues using browser DevTools and manual API verification, escalating findings to backend engineers with clear documentation.
- Tested Azure account connectivity flows to confirm secure onboarding into the DartCloudFunctions platform.
- Collaborated with backend engineers to validate fixes before release, and with product teams on free-trial onboarding and retention workflows.
- Built foundational knowledge of production systems and enterprise SaaS architecture through hands-on investigation of real customer-reported issues.

PROJECTS

Pawthway — Full-Stack Pet Adoption Platform (React, Firebase, Tailwind)

- Engineering challenge: build a multi-role adoption platform where admins and users needed securely separated data access and workflows.
- Architecture: React frontend with a Firebase backend (Auth, Firestore, Storage), using reusable component patterns across admin and user dashboards.
- Authentication: implemented RBAC-based authentication with protected routes to separate admin and user permissions.
- Data & reliability: used Firestore realtime sync for adoption workflows, and handled edge cases in role-based access and data consistency.
- Engineering decisions: as sole developer, traded off build speed against maintainability — chose Firebase over a custom backend to move faster while still owning architecture, debugging, and deployment end-to-end.

Crypto Dashboard — Realtime Analytics (Next.js, React, Chart.js, Web3.js)

- Engineering challenge: display live cryptocurrency market data with acceptable load performance and consistent state under frequent updates.
- Architecture: Next.js with server-side rendering for initial load, combined with client-side chart rendering and Web3 wallet connectivity.
- Debugging & performance: diagnosed and resolved data-sync and state-consistency issues from live API polling, and optimized rendering to avoid unnecessary re-renders.
- Scalability: structured data-fetching and component state so additional data sources (new coins, exchanges) could be added without reworking the rendering layer.

AI Notes Summarizer — PDF Text Extraction Tool (Python, Streamlit, NLP, Sumy)

- Engineering challenge: extract concise, readable summaries from unstructured, inconsistently formatted PDF documents.
- Architecture: built a Python processing pipeline combining PDF text extraction with an NLP summarization layer, exposed through a Streamlit interface.
- Reliability: handled parsing edge cases across varied PDF formatting and tuned summarization controls to balance readability against information retention.

EDUCATION

- Bachelor of Technology, AI & Data Science Engineering — Jawaharlal Nehru Engineering College, MGMU, Aurangabad, Maharashtra, India
- Diploma, Computer Engineering — People's Education Society, Aurangabad, Maharashtra, India
